Healthy Families  
and Communities

## UC ANR: Our Public Value

The difference we make...

- Promoting economic prosperity in California
- Developing a qualified workforce for California
- Safeguarding abundant and healthy food for all Californians
- Protecting California’s natural resources
- Building climate-resilient communities and ecosystems
- Promoting healthy people and communities
- Developing an inclusive and equitable society

University of California  
Agriculture and Natural Resources

*A Celebration of Science and Service*

# Goal of the “Spotlight” series

Provide an upbeat, interactive opportunity to see

how the work of UC ANR is making a difference:

- breakthroughs, challenges and needs.

# SI Spotlight Webinar

Highlighting Work across the UC ANR Strategic Initiatives

# Trees for Tomorrow Start Today

Janet Hartin

Area Environmental Horticulture Advisor  
(San Bernardino, Riverside, and Los Angeles Counties)

# Introduction

## Did you know?

- Landscape trees help reduce impacts of climate change
- California has the lowest tree canopy per capita (108 yd<sup>2</sup> ) in the USA

(climate-ready tree research plot at UCR)

# Properly selected and maintained landscape trees:

- Mitigate climate change by storing carbon dioxide
- Cool urban heat islands
- Provide shade/conserves interior energy
- Improve water quality
- Provide wildlife and pollinator habitat
- Beautify neighborhoods

# Problem

Trees often underperform in urban settings due to:

- poor species selection
- poor care

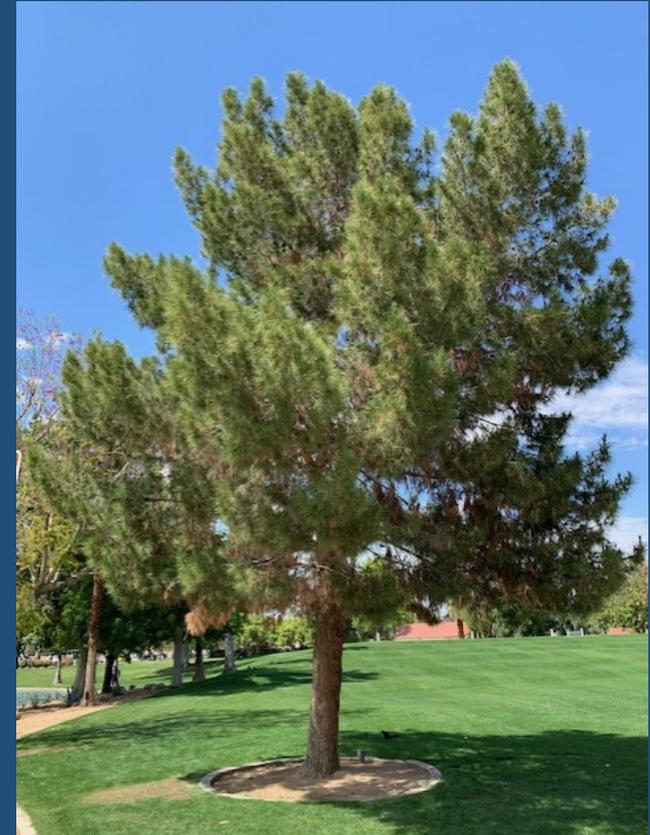

(invasive bluegum eucalyptus)

# Tree Care 101

# Replace The Don'ts

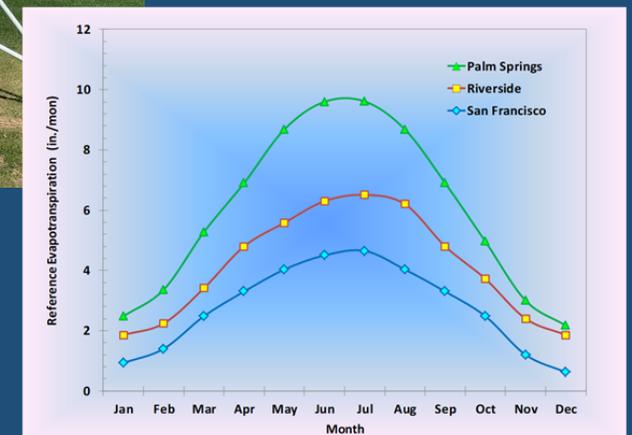

# With The Do's

# What UC ANR environmental horticulture advisors, specialists, and UC partners have done to promote proper tree selection and care:

- Determined minimum irrigation requirements
- Developed the WUCOLS database (over 3,000 entries)
- Identified tree species expected to perform well in warming climates
- Educated professional horticulturists
- Educated the public via Master Gardeners
- Published results

## Water Requirements of Landscape Plants Studies Conducted by the University of California Researchers

Janet S. Hartin<sup>1,7</sup>, David W. Fujino<sup>2</sup>, Lorence R. Oki<sup>3</sup>, S. Karris Reid<sup>4</sup>, Charles A. Ingels<sup>5</sup>, and Darren Haver<sup>6</sup>

**ADDITIONAL INDEX WORDS.** landscape water use, evapotranspiration, landscape irrigation, CIMIS, plant factor, ETAP, WUCOLS

**SUMMARY.** University of California (UC) researchers have been involved in research and extension pertaining to measuring evapotranspiration (ET) rates and determining the minimum irrigation requirements of landscape plants for more than 30 years. Early work included the design and implementation of the California Irrigation Management Information System (CIMIS) weather station network and determining crop coefficients for warm and cool season turfgrasses based on historical ET and CIMIS data. Other researchers determined the minimum irrigation requirements for several species of established landscape trees, shrubs, and groundcovers in diverse climate zones throughout the state. In addition, the Water Use Classification of Landscape Species (WUCOLS) system was developed by UC personnel in the early 1990s which, to date, has classified more than 3500 landscape species into very low, low, moderate, and high water-use categories based on observation and personal experience by industry experts and UC personnel. Future work in the area of landscape water use and conservation will include updating WUCOLS as more data from replicated trials become available. New research at UC Riverside aims to improve irrigation efficiency (IE) through precision irrigation using smart controllers, remote sensing, and geospatial analysis under controlled conditions. Irrigation training and certification for public and private landscape managers must remain a priority because, even with advanced smart controller technologies, water savings will not occur with poorly designed and functioning irrigation systems.

Between 40% and 70% of water used in urban settings in the United States is applied to

This article results from the workshop "Maintaining Healthy Landscapes Under Drought and/or Permanent Water Restrictions" held on 20 Sept. 2017, at the ASIS Annual Conference, Waikoloa, HI and sponsored by the Ornamentals/Landscape and Turf (O/LT) Professional Interest Group.

Appreciation is extended to Workshop fellow presenters Raul Cabrera, Michael Dukas, and Ursula Schuch, session attendees, and the O/LT Professional Interest Group.

Authors received funding from California Department of Water Resources, Saratoga Horticultural Foundation, and Metropolitan Water District of Southern California.

ET rates higher than those in coastal areas, more water is required for their irrigation.

Climate change poses additional challenges to urban landscapes as rising temperatures coupled with limited water exacerbates the need to increase and diversify the palette of trees and other ornamentals adaptable to harsh urban conditions (Bohn et al., 2018; Hanak and Lund, 2008). Furthermore, Fall 2011 through Fall 2015 was the driest 4-year period in recorded history in California since the beginning of weather tracking in 1895, exacerbated with record high temperatures in 2014 and 2015 (Hanak et al., 2015). Although precipitation in 2016 and 2017 rose to near-average levels in much of northern California, all of central and southern California continue to experience moderate or severe drought as of 10 Mar. 2018 (Fenimore, 2018).

An increase in California's population coupled with a multiyear drought in the 1980s requiring greater landscape water conservation led to the enactment of the California Assembly Bill 325 (Water Conservation in Landscaping Act), which became effective in 1993. The act required the California Department of Water Resources (CDWR) to develop a Model Water Efficient Landscape Ordinance (MWELO), intended to increase water conservation in urban landscapes. This included reducing water waste in landscape plantings and listing landscape plants within WUCOLS water-use categories to supplement the small number of actual plants whose water use had been measured in field studies, a lengthy and resource-intensive process.

The assumed a leadership role in WUCOLS, bringing together 36 experts from the landscape industry who categorized thousands of plants in six climate zones (north central valley, central valley, south coastal, south inland valley, high and intermediate desert, and low desert) as very low, low, moderate, or high water users. Since the inception of WUCOLS, additional species were

### RESEARCH ARTICLE

## UC ANR research and education influences landscape water conservation and public policy

For more than 30 years, UC has tackled the obstacles that inhibit widespread landscape water conservation, with new science, trainings and contributions to state policy.

by Janet S. Hartin, Lorence R. Oki, David W. Fujino, Karris Reid, Charles A. Ingels, Darren L. Haver and William N. Baker

For nearly three decades, California has mandated practices to improve landscape water use efficiency and conservation. The goal of state policies has been to ensure a steady and reliable water source while maintaining healthy sustainable landscapes. Strategies have included the adoption of landscape irrigation standards, water budgets and tiered water rates favoring conservation, and also increased education to the landscape industry and the public. UC has been influential in developing and providing credible science-backed information to inform legislative actions. It has also reduced the obstacles that were inhibiting widespread landscape water conservation: a lack of credible information regarding landscape water requirements, inadequate training across a large segment of the landscape industry, lagging irrigation system technology, and an inadequate supply of locally available drought-resistant landscape plants.

Online <https://doi.org/10.21273/hort.2018.04041>

### Abstract

UC has been heavily involved in research and extension efforts impacting landscape water conservation legislation for over 30 years. In 1981, UC implemented the California Irrigation Management Information System, a network of weather stations that provides data for local estimates of plant water needs. Those estimates led to UC being able to advise the California Legislature on policies for maximum applied water allowances for residential and large landscaping projects. The allowances have been reduced significantly with UC guidance, and UC has helped landscapers to meet the increasingly restrictive requirements. Best practices that reduce water losses have been developed in collaboration with equipment manufacturers and landscaping specialists, and explained to end users. In addition, UC has developed the WUCOLS database, which classifies over 3,500 plants by their water needs. UC's involvement in landscape water conservation continues on many fronts, developing science and contributing to policy.

# Water savings potential in professionally managed landscapes study

(Hartin, Fujino, Oki, Haver, Reid & Ingels)

- Implementing ‘best practices’ improves plant health and saves between 1.3 million to 2.9 million acre-feet of water annually

|     |  |
|-----|--|
| 1.  | Adopt water-conserving rate structures as defined by the task force  |
| 2.  | Reduce the ETAF (landscape water budget) in MWEL0 and review it every 10 years for possible further reduction  |
| 3.  | Enforce and monitor compliance with local ordinances and MWEL0   |
| 4.  | Require dedicated landscape meters   |
| 5.  | Promote the use of recycled water in urban landscapes  |
| 6.  | Require that local ordinances be at least as effective as MWEL0  |
| 7.  | Increase the public's awareness of the importance of landscape water use efficiency and inspire them to action |
| 8.  | Require smart controllers  |
| 9.  | Adopt and enforce statewide prohibitions on overspray and runoff   |
| 10. | Provide training and certification opportunities to landscape and irrigation professionals                     |
| 11. | Support upgrading CIMIS  |
| 12. | Adopt performance standards  |

# 'Space for Time' substitution study

(Igor Lacan and Joe McBride)

- Paired 16 cities to cities in warmer climate zones (CalAdapt)
- ½ of current tree species may be unsuitable
- 7 inland cities may suffer substantial species losses if substitutions do not occur

Example: Fresno will be as warm in 2099 as El Centro is today

# Space-for-time substitution results

# Climate-ready landscape trees study

(Berry, Hartin, Downer, Haver, & USDA Forest Service)

- Measuring performance of select landscape tree species based on drought resistance, maintenance, CO<sub>2</sub> sequestration, soil tolerance, pest resistance, shade, biodiversity, rareness, longevity, etc.
- UCR, SCREC, UC Davis, area parks

# Climate ready tree study (con'd)

- Measuring performance of 4 of the same species in a mulch/no mulch study

'Maverick' Mesquite

'Red Push' Pistache

'Bubba' Desert Willow

'Desert Museum' Palo Verde

# 'Trees for Tomorrow' workshops (Hartin)

- Goal: to increase urban tree canopies to  $\geq 25\%$  within 20 years through an interactive process with stakeholders
- 3-4 locations

**Trees for Tomorrow**  
INCREASE TREE CANOPIES TO COOL URBAN HEAT ISLANDS

# Master Gardener involvement:

MGs in San Bernardino and Riverside Counties are:

- taking quarterly data on the mulch/no mulch 'climate-ready trees' study
- recording tree care data in their neighborhoods for the 'Trees for Tomorrow' workshops and facilitating breakout sessions

(Master Gardeners take data for the climate-ready mulch/no mulch study)

If you remember one thing,  
remember this....

- Proper tree selection and care helps ensure a healthier tomorrow.....one tree at a time!
